Design: Reason-based repeat-order messages for social sellers (fixing the win-back cadence)

Generated by /office-hours on 2026-10-02 Branch: main Repo: HarshModi1412/Art Status: APPROVED (user: “take all the recommended one”; 28 reviewer concerns recorded, not fixed) Mode: Startup Follows: Harsh-main-design-20261001-205124.md (prior design on this branch, Reel 5; different topic, nothing replaced) Related: `GO_TO_MARKET.md` v3 (entry offer: free Win-Back Session), `docs/designs/us-pivot-five-seller-test.md`, `.planning/quick/261002-wg2-campaign-types/261002-wg2-PLAN.md` (in progress)

Problem Statement

`GO_TO_MARKET.md` v3 leads with a free Win-Back Session. The founder asked whether the idea holds for sellers who sell on Instagram and WhatsApp: “if someone bought a T-shirt from you, then sending them a message after 1 month and then after that every two weeks, is it a good idea or not?” If not, what should we do instead?

Short answer: no for clothing and jewellery, yes only for products that run out (attar, skincare). Message each buyer when there is a reason tied to what they bought, not on a timer.

Demand Evidence

- None yet. No seller has been asked how they handle past buyers (D1: “haven’t asked yet”). The “they have data but never act on it” idea in `us-pivot-five-seller-test.md` is also unheard from any seller.

- Outside benchmarks (retention-vendor blogs, directional only, not Indian or social-seller data):
 - Apparel: about half of second orders come within 30 days of the first, and three-quarters within 90 days. The 12-month repeat rate is about 20 to 26%. ([eightx](#), [RetentionLab](#))
 - Buyers quiet for 60 to 120 days are the most recoverable, and win-back there recovers about 4 to 8% of them. Post-purchase follow-up matters more than win-back for apparel. ([eightx](#))
 - WhatsApp: repeating a marketing message to the same person more than once a week reads as spam. For **WhatsApp Business Platform (API) numbers**, a block rate above about 2% lowers the quality rating and limits sending. Vendor guidance, not WhatsApp's own rule text. ([ChatMaxima](#), [Kanal](#), [Spotler](#))
 - Sellers who tap-send from their own WhatsApp Business app have no published quality score, but blocks and spam reports can still get a number restricted. Business-app broadcast lists only reach contacts who saved the seller's number.

Status Quo

Unknown. How sellers handle past buyers today (broadcast to all, message a few regulars by hand, or nothing) has not been heard from a seller. The assignment closes this.

What the app does (re-checked in the working tree, 2 October 2026, 23:30 IST)

The campaign code was being changed by a parallel session while this design was written (`.planning/quick/261002-wg2-campaign-types`, uncommitted). Facts below are from that working tree.

- **Seven campaign types, each with its own audience** (`analytics.campaign_audience` , `campaign_engine.REASONS`):

Type	Audience
winback	At Risk plus Hibernating buyers quiet up to 365 days
festival	Champions, Loyal, top 20% spend, At Risk
second_order	one order only, 14 to 60 days ago
cross_sell	owns X, not Y, for a strong “bought together” pair
restock	past their usual reorder gap for a product
vip	Champions
thank_you	last order 2 to 14 days ago

- **Each type has its own cooldown** (`campaign_engine.COOLDOWN`): winback 45, festival 14, second_order 30, cross_sell 21, restock 14, vip 14, thank_you 30 days. The wait is counted from the last contact by any campaign, but its length depends on the new campaign’s type. So a festival offer can follow a win-back offer 15 days later. There is no single per-buyer offer limit across types.
- **”No discount” is now possible for every type**, using a silent tracking code instead of a visible one.
- **The default win-back voice is the “bad” message.** “It’s {brand}... we’ve missed you”, plus a 10% code (`campaign_writer` win-back voices; `winback_auto.DEFAULT_OFFER` 10%). A reason-based message exists only if the seller edits each row (`message_override`).
- **Sending paths:**
 - **Tap-to-send** (no WhatsApp API connected): each customer gets a `wa.me` link with the row’s message, edits included. The seller taps send.
 - **Automatic** (WhatsApp Cloud API connected): sends a fixed approved template built from the voice’s pitch. **Edits are ignored.**
 - **Email:** approving defaults to WhatsApp and email together. Email goes from the seller’s mailbox and has **no unsubscribe link.**
- **The automatic batch is on by default.** `winback_auto` turns itself on at first check. Every second Monday it puts a win-back batch (up to 60 buyers, 10% offer) in the Approval panel, or a festival batch when a festival is within 21 days. It never sends without approval.
- **Restock** guesses the reorder gap from repeat purchases of the same product. Products nobody has bought twice get no reminder. There is no “this bottle lasts N weeks” setting.

- **The app cannot read Instagram DMs or comments.** Scopes are basic, publish and insights only (`backend/core/instagram.py:60`).
- **The app does not record opt-in.** Nothing stores whether a buyer agreed to repeat messages.

Target User & Narrowest Wedge

- **User:** a 1 to 3 person Instagram/WhatsApp shop selling clothing, jewellery or attar in India (US Shopify sellers second). No named seller yet.
- **Branch A / Branch B** (from `GO_TO_MARKET.md` v3, section 1): Branch A sellers have an order file with dates, amounts and customer phones. Branch B sellers keep orders only in chats.
- **Wedge:** the free session finds the next orders in a seller's past buyers. What changes is **what gets sent**: reason-based messages chosen by product type and time since purchase.

Constraints

- Full-time job; sessions happen in IST evenings, about 30 minutes each.
- **Gate for new product features** (replaces the US-only gate this doc used to cite): no further campaign features after 261002-wg2 until 5 sellers (any market) have each sent at least 5 reason-based messages and reported replies at their day-4 check-in. 261002-wg2 is the founder's explicit exception, already in progress.
- Every session message goes from the seller's own WhatsApp. Losing that number is fatal to their business.
- `Brand.md` honesty rules: no invented results; label samples.

Premises (agreed; founder chose “take all the recommended”)

1. "Day 30, then every 2 weeks" is wrong for clothing and jewellery. A timer fits only products that run out (attar, skincare).
2. Every message needs a buyer-specific reason: a new drop in what they bought, a restock, the festival they bought for last year, a matching piece, or a thank-you and review request. No reason, no message.
3. Three money windows, ranked:
 - the first 30 days after a purchase (the second sale);
 - people who asked “price?” and never bought;
 - buyers quiet for 60 to 120 days (about 4 to 8% recovery).

4. A thank-you about their order is expected. Repeat offers and drop alerts need the buyer's YES. Silence counts as no.
5. The free session stays, but promises “find your next orders in your past buyers”, not “message everyone every 2 weeks”. It is a bet until 3 sellers describe how they handle past buyers.

Approaches Considered

- **A: Fix the message, keep the session.** Same session; reason-based rules; in-app tap-to-send with “No discount” and edited rows. Effort S for the plan; each session adds about 10 minutes of message edits. **Chosen.**
- **B: Repeat-order campaign types in the app. In progress in a parallel session (261002-wg2),** by the founder’s own decision. It covers thank-you, second-order, cross-sell, restock and VIP. It does not cover opt-in records or a per-buyer offer limit across types. Sessions use B’s types as soon as they ship; until then, use win-back and festival with “No discount” and hand-edited rows.
- **C: Lead with people who asked “price?” and never bought.** The app cannot see DMs. Not built. Sessions only ask the question (see Open Questions).

Recommended Approach: A, using B’s campaign types as they ship

DEFINITIONS

- **Offer message:** contains a discount, a code, or a direct “buy now” ask.
- **Update message:** a thank-you, a review request, a drop or restock alert with no discount, a refill reminder with no discount.
- **Reason:** something new and specific to that buyer: a new or restocked piece in their favourite category, a matching piece, last year’s festival, a refill due, or their recent order.

MESSAGE RULES

Message	When	Needs a prior YES?	Type in the app
Thank-you + review/photo request + YES ask ("Want a message when new [category] drops? Reply YES")	Order date + the seller's usual delivery days + 2 days (about days 4 to 10)	No: every buyer gets this once	thank_you
Second piece: a matching item or a new drop in their category	Days 14 to 60 after the order, only with a reason	No, once; it carries the YES ask. After that, YES only	second_order, cross_sell
Refill reminder (attar, skincare)	Past their usual gap (app restock list), or the seller's stated bottle life	No, once, with the YES ask. After that, YES only	restock
Festival message	2 to 3 weeks before the festival, to buyers who ordered in the 30 days before last year's festival (Diwali 2025: 20 October 2025)	No, once, with the YES ask	festival, list filtered by order date
Win-back	Quiet 60 to 120 days (first sessions). Up to 365 days only with a strong reason	No, once, with the YES ask	winback
New drop broadcast	When something new arrives	Yes	vip or a hand-picked list

LIMITS ON HOW OFTEN (PER BUYER)

- **Offer messages:** at most 1 per 30 days across all types. The app does not enforce this across types, so the seller checks the send log.
- **Update messages:** at most 1 per week.
- **Without a YES:** at most 1 message per type ever, plus the thank-you. No reply counts as no.
- **Stop rule:** 2 unanswered messages in a row, then stop. **A new order or any reply resets the count.**
- **Never:** the same text twice to one person, or a discount with no product reason.

- **Broadcasts:** send to YES buyers one by one (tap-to-send), not through a broadcast list. Broadcast lists only reach people who saved the seller's number.

THE SEND LOG AND THE YES RECORD (NO NEW FEATURES NEEDED)

- **The send log:** in-app sends are logged by the app (`campaign_engine` history, `winback_proof`). Hand-sent messages go into a **session sheet** the founder keeps per seller:

buyer		date		type		reason		offer or update		try number		replied (Y/N)		ordered within 7 days (Y/N)
-------	--	------	--	------	--	--------	--	-----------------	--	------------	--	---------------	--	-----------------------------

- **The YES record:** a WhatsApp Business label “YES-drops”, or a “YES” column in the seller's order sheet or the session sheet. Check it before any broadcast or repeat offer. An app-side opt-in record is a later feature.

SESSION STEPS (BRANCH A, 15-MINUTE TIMEBOX; REPLACES V3'S BRANCH A STEPS)

1. **Current reasons (2 minutes).** The seller names what is new or restocked, by category, plus any festival within 3 weeks. If there is none, they photograph one piece now; that becomes the reason.
2. **Thank-you first (3 minutes).** Open the `thank_you` list (or filter the upload to orders 2 to 14 days old). Send thank-you + YES ask to up to 5 buyers. This window ranks first, and the message is welcome, so it is the safest first send.
3. **Reasoned past buyers (8 minutes).** Open `second_order`, `cross_sell`, `restock`, or `winback` filtered to 60 to 120 days quiet. Keep only buyers whose favourite category matches a current reason. Take the top 10 by past spend. Set **No discount**, edit each row to name the reason, send by tap-to-send.
4. **Zero-reason fallback.** If steps 2 and 3 find nobody, send nothing to past buyers. Close on the thank-you habit: “Every buyer from now on gets this message on day 4.”
5. **Log it.** Fill the session sheet during the call.

Example messages:

- Bad: “Hi! We miss you. Get 10% off your next order.”
- Good: “Hi Priya, the indigo block-print kurta you took in March is back in two new colours. Want pictures?”

SETTINGS FOR EVERY SESSION

- WhatsApp: **tap-to-send only.** The automatic template ignores edits.
- Email: **unticked** in sessions. US email stays off until win-back emails carry an unsubscribe link.

- Automatic every-second-Monday batch: **switch it off during the session**. Reconsider at day 14 once the seller has run two types by hand.
- Price-askers (Approach C): sessions only ask the question. No coaching, so no rules are needed yet.

CHANGES TO `GO_TO_MARKET.MD` (VERSION 4)

1. **Pitch**: “your next orders are in your past buyers”. Win-back is one window of three.
2. **Branch A session steps**: replace with the five steps above.
3. **Refill demo for attar and skincare**: use the restock list if it is not empty. Otherwise the seller states bottle life (for example “6 ml lasts about 6 weeks”) and the founder filters the upload by hand. A per-size setting goes into a later feature.
4. **”After yes”**: replace “switch on the weekly win-back” with “thank-you on for every new buyer; second campaign type run by hand at the day-4 check-in”.
5. **New session question**: “Which loses you more money: people who ask the price and don’t buy, or buyers who never come back?”
6. **Metrics**:

v3 metric	v4 replacement
”Messages sent on the call: 8”	”Reason-based messages sent”, no target (baseline)
”Reply rate 15%+ / 10%+”	Reply rate measured, no target until 10 sessions
”Weekly win-back switched on: 70%”	”Seller ran a second campaign type by hand by day 14”
Decision rule “60%+ of Branch A got a reply or order in 7 days”	The decision rules below

7. **Copy**: DMs and ads drop any “message every 2 weeks” idea.

Decision rules (after the first 10 sessions)

What we see	Decision
Any seller reports a WhatsApp warning, restriction, or 2+ blocks	Stop offers to non-YES buyers entirely; updates only
In most sessions the seller can name a reason for fewer than 3 past buyers	Lead the session with thank-you and second-order, not win-back
Reason-based messages get replies in at least half the sessions	Keep the rules; set the first reply-rate target from the observed median
3 of the first 5 sellers say price-askers are the bigger leak	Run an office-hours session on Approach C (manual follow-up first)
Status-quo answers show sellers already message buyers by hand with reasons	Change the pitch to “the list and the message, done for you every week”

Open Questions

- Does the 60 to 120 day filter leave enough buyers in small shops? Record list sizes and “last bought” dates in the first 5 sessions.
- Do Indian DM sellers keep buyer phones in a file (Shiprocket, courier)? This decides how many sessions are Branch A.
- Is “price? and never bought” the bigger leak? See the decision rules.
- 261002-wg2 is still in progress: when it lands, re-check the default voices, cooldowns and “No discount” behaviour before the first session.

Success Criteria and how each is measured

Criterion	How it is measured
3 sellers describe how they handle past buyers, by 9 October 2026	Exact quotes in the lead sheet’s “Their exact words” column
Zero messages sent without a reason in the first 10 sessions	Session sheet: every row has a reason
Zero WhatsApp warnings or restrictions	Day-4 check-in question: “Any warning from WhatsApp, or anyone block you?”
Reply-rate baseline	Replies within 7 days ÷ messages sent, per seller, from the day-4 and day-7 check-ins
Leak tally	Session question answer, counted across sessions

Dependencies

- 261002-wg2 lands and passes its tests.
- `GO_TO_MARKET.md` v4 edit and PDF (not done here; office hours writes design docs only).
- An unsubscribe link before any US email sends.
- Approach C automation needs the Instagram messaging permission and Meta app review. Out of scope.

The Assignment

Keep outreach going, and put the two questions into it. In the next 3 days, ask at least 3 sellers these two questions (warm network by WhatsApp or phone, and as the follow-up to any Tier A seller who replies to a DM). Write down their exact words.

1. "When someone bought from you 2 or 3 months ago and hasn't come back, what do you do?"
2. "Which loses you more money: people who ask the price and don't buy, or buyers who never come back?"

If fewer than 3 have answered by 9 October: call 3 people from your warm network who sell anything online, and ask the same two questions by phone. A shop outside our niche still tells us the habit.

What I noticed about how you think

- You questioned your own entry offer before sending a single DM: "is it good idea or not, use office hours to critic this". Most founders defend the plan they just wrote.
- An hour earlier you rejected the website pitch: "selling them a website is not a moat; giving them a system which runs the business is the moat." These message rules apply the same thesis. The system's value is knowing *why* to message someone, not *how often*.
- While this session ran, a parallel session of yours was adding thank-you, second-order, restock and VIP campaigns, and a "No discount" option. You were already moving toward reason-based messages. This doc gives that build the rules it needs.
- You answered with "take all the recommended one." That keeps you moving, but these premises rest on vendor benchmarks, not your sellers. The assignment exists so their words replace my defaults.

Reviewer Concerns

Disposition: CONCERNS_RECORDED

Stop: CONVERGENCE

R2-1 — FEASIBILITY

Problem

Approach B says that until 261002-wg2 ships, sessions ‘use win-back and festival with “No discount” and hand-edited rows’. ‘No discount’ is part of 261002-wg2 itself: the plan’s task 1 is ‘discounts: kind “none” (0 off, tracking only)’. Without it, `campaign_writer.valid_override` rejects any edit that drops the customer’s code (‘Keep the customer’s code ... in the message’), so every hand-edited win-back or festival row must still carry a discount code, which makes it an offer message. Dependencies also lists ‘261002-wg2 lands and passes its tests’. The ‘until then’ fallback cannot run as written.

Remedy

Make 261002-wg2 (at least ‘No discount’ and the `thank_you` list) a hard prerequisite for the first session, and delete the ‘until then’ fallback. Or define a pre-wg2 path that works, for example messages written and tap-sent by hand from the seller’s phone and logged in the session sheet.

R2-2 — COMPLETENESS

Problem

The table says the thank-you and every first-contact message carry the YES ask (‘Want a message when new [category] drops? Reply YES’). None of the app’s voices contains it. The `thank_you` ‘offer_none’ lines ask for a review or photo. The `second_order`, `cross_sell`, `restock`, `festival` and `winback` voices have no opt-in line. Step 2 says ‘Send thank-you + YES ask’ but never says to edit the rows. Step 3 says to edit each row ‘to name the reason’, not to add the YES ask. The ‘Good’ example (‘...back in two new colours. Want pictures?’) has no YES ask either. Run as written, the first sessions send first-contact messages that never ask for YES, so no opt-in is collected.

Remedy

Add ‘append the YES line’ to the row edits in steps 2 and 3, add the line to the Good example, and budget the time. Or record the YES line as a voice change in 261002-wg2 that must land before sessions.

R2-3 — CONSISTENCY

Problem

The first decision rule responds to a WhatsApp warning, a restriction or 2+ blocks with 'Stop offers to non-YES buyers entirely; updates only'. Session messages are already updates: step 3 sets No discount, and the thank-you is an update. So the rule changes nothing in the flow that triggered it. The seller keeps sending first-contact messages to non-YES buyers from a number that the constraints call 'fatal' to lose.

Remedy

Make the response protect the number. On any warning or restriction, stop all messages to that seller's non-YES buyers and pause their sessions until the cause is reviewed. Across sellers, review the message and list rules before the next session.

R2-4 — CONSISTENCY

Problem

The founder keeps a session sheet per seller that records each buyer, date, reason, reply and order. GO_TO_MARKET v3 tells sellers 'You upload it yourself, into your own account. I never see the file.' Its data rules say 'Never collect customer files by DM or email' and cite India's DPDP Act. A founder-held, buyer-level record of messages and purchases breaks that promise and makes the founder a holder of the buyers' personal data.

Remedy

Have the seller keep the sheet in their own account or drive, with the founder recording only counts, or log buyers by an ID or initials. If the founder must hold buyer names, change the v3 data promise and get the seller's consent.

R2-5 — CONSISTENCY

Problem

Premise 4 says 'Repeat offers and drop alerts need the buyer's YES. Silence counts as no.' The table lets a non-YES buyer receive, once each, a second-piece message ('a new drop in their category', a drop alert), a refill reminder, a festival message and a win-back, each repeating the YES ask. A buyer who ignored the thank-you's YES ask has already said no under premise 4, yet the table asks again up to four more times. The stop rule cuts this off only after 2 unanswered messages in a row, and a new order resets the count.

Remedy

Choose one rule and state it in both places. For example: silence on a YES ask means no further YES asks, and a non-YES buyer gets the thank-you plus at most one first-contact message per quiet spell. Or narrow premise 4 to 'repeat offers and broadcasts need YES; one first-contact drop alert is allowed'.

R2-6 — CONSISTENCY

Problem

GO_TO_MARKET v3 section 9's Branch B launch sale sends a WhatsApp 'Broadcast to past buyers' with the launch offer on day 0 and a 'Final broadcast' on day 4. This breaks four of this design's rules: offers to non-YES buyers, sending through a broadcast list (the design says 'send to YES buyers one by one'), at most 1 offer per 30 days, and at most 1 update per week. The v4 change list does not mention the launch sale.

Remedy

Add the launch sale to the change list: past buyers get the launch offer once, as individual messages with the YES ask (or only YES buyers get it), and the day-4 'final broadcast' moves to Status and Instagram only.

R2-7 — CONSISTENCY

Problem

GO_TO_MARKET v3 section 9's Branch A activation table still says 'Day 1 to 3: They send the rest of the list' and 'Day 7: Weekly win-back switched on (activation 2: the habit)'. Sending the rest of the win-back list ignores the reason rule. Switching on the weekly win-back contradicts this design's setting that turns the automatic batch off. Change 4 fixes only the 'After yes' line.

Remedy

Add section 9 to the v4 change list. Replace day 1 to 3 with 'send only rows that have a reason' and day 7 with the thank-you habit and a second campaign type run by hand.

R2-8 — CONSISTENCY

Problem

Change 2 replaces only the Branch A steps. v3's Branch B step 3 stays: 'Win-back by hand... scroll to people who bought 2 to 6 months ago... Let's do 5 anyway.' It picks buyers by elapsed time alone, partly outside the 60-to-120-day window, with no reason check, no YES line and no session-sheet row.

Remedy

Add a v4 Branch B step that applies the same rules: up to 5 chats that have a current reason (or recent buyers for a thank-you plus YES ask), each logged.

R2-9 — CONSISTENCY

Problem

Change 6 replaces the row “Reply rate 15%+ / 10%+” with a buyer reply-rate baseline. In GO_TO_MARKET v3 section 13 that row sits directly under ‘DMs sent’: it is the outreach DM reply rate, not the buyers’ reply rate (round 1 misread it the same way). The buyer-reply target, ‘Sellers with a customer reply within 24 hours: 60% of Branch A / 50%’, is untouched and conflicts with ‘no target until 10 sessions’. The change also drops the outreach DM target by mistake.

Remedy

Keep the DM reply-rate row. Replace ‘Sellers with a customer reply within 24 hours’ with the baseline measure: replies within 7 days ÷ messages sent, no target until 10 sessions.

R2-10 — FEASIBILITY

Problem

Approach A estimates ‘about 10 minutes of message edits’ per session. The 15-minute Branch A timebox gives step 3 eight minutes to open up to four lists, filter them, match categories, pick the top 10, set No discount, hand-edit 10 rows and tap-send 10 messages. Step 2 has three minutes for up to 5 thank-yous, which also need edits to add the YES ask (R2-2). Step 5’s logging has no time at all. The timebox cannot hold the edit time Approach A itself estimates.

Remedy

Re-budget Branch A from real edit times. For example, cap step 3 at 5 buyers, or lengthen Branch A and shorten the demo. Say what happens to buyers not reached on the call: who sends to them later, and in which log.

R2-11 — FEASIBILITY

Problem

Step 3 asks to filter win-back to '60 to 120 days quiet', keep buyers 'whose favourite category matches a current reason', and 'take the top 10 by past spend'. Drafts have no filters. `update_draft` can only remove rows, and a draft row carries `favorite_item` and `recency_days` but no favourite category. The win-back audience is At Risk plus Hibernating, so buyers 60 to 120 days quiet whom RFM classes as New Customers or Loyal never appear in it. The `cross_sell` list has no 14-to-60-day limit, although the 'Second piece' row needs one. Drafts of 20 or more rows also hold out a random tenth, which can drop top spenders from the list.

Remedy

State how each filter is applied: sort the uploaded file by hand, or remove draft rows, with category judged from the favourite item. Name the list that holds 60-to-120-day buyers outside At Risk and Hibernating. Record any filter the app needs as a post-gate feature.

R2-12 — FEASIBILITY

Problem

The festival row targets 'buyers who ordered in the 30 days before last year's festival' via 'festival, list filtered by order date'. The app's festival audience is Champions, Loyal, At Risk and top-fifth spenders. A one-time buyer from late September or October 2025 is about a year quiet, so RFM usually classes them as Hibernating and they are not on the list. The draft has no order-date column or filter, and it is capped at 150 rows by spend. The 'last Diwali's buyers' send planned for the week of 19 October would miss most of its intended buyers.

Remedy

Name the festival list's source. For example, filter the uploaded order file by order date by hand, tap-send outside the campaign screen, and log it in the session sheet. Or state that only buyers already in the app's festival list are messaged, and the rest are skipped.

R2-13 — FEASIBILITY

Problem

The after-yes change says 'thank-you on for every new buyer', and step 4 closes with 'Every buyer from now on gets this message on day 4'. Nothing in the app turns a thank-you on. The automatic job stays win-back and festival (261002-wg2 plan: 'The automatic every-second-Monday campaign stays festival / win-back'). The `thank_you` list sees only orders in the latest upload or on the website, and covers last orders 2 to 14 days old. A day-4 message per buyer would need a fresh upload and a manual run every few days.

Remedy

State the real mechanism and cadence. For example: the seller uploads orders and runs thank_you once a week, so each buyer is thanked between day 2 and day 14. Or the seller sends the thank-you by hand when delivery is confirmed. Reword the step 4 close to match.

R2-14 — FEASIBILITY

Problem

The new-drop broadcast row needs a prior YES and uses 'vip or a hand-picked list'. The app does not store YES. The vip audience is Champions only, so YES buyers who are not Champions cannot be in it, and Champions without a YES must be removed by hand. A draft can drop rows but cannot add buyers, so there is no in-app 'hand-picked list'. A vip campaign also requires a note.

Remedy

State that broadcasts go by hand to the buyers in the YES record (label or YES column), one by one from the seller's phone, and are logged. Or name the in-app list and the step that removes every row without a YES.

R2-15 — FEASIBILITY

Problem

'WhatsApp: tap-to-send only' is listed as a session setting, but the app has no such setting. whatsapp.status reports mode 'auto' whenever the Cloud API is connected and the template is approved. campaign_engine.send then sends the fixed template (the 'update' template for No discount) and ignores edited rows. The only ways back to tap-to-send are unticking WhatsApp, which sends nothing, or disconnecting the number.

Remedy

Make the session check the WhatsApp mode first. If it is 'auto', either send the edited messages by hand outside the app or disconnect for the session. Or run sessions only with sellers whose mode is 'tap'.

R2-16 — CONSISTENCY

Problem

The send-log section says the app logs in-app sends and 'Hand-sent messages go into a session sheet'. But every session message is sent in-app by tap-to-send (steps 2 and 3). Step 5 ('Fill the session sheet during the call') and the success criteria ('Session sheet: every row has a reason') assume the sheet holds every message. The app's history has no per-buyer reason, try number or replied field, so neither the stop rule nor the reason audit can be checked for in-app sends.

Remedy

State that every message, in-app or by hand, gets a session-sheet row. Or say which columns the app's history supplies and how the rest are captured for in-app sends.

R2-17 — COMPLETENESS

Problem

The frequency, once-per-type, stop and YES rules apply to every send, but most sends happen after the call: the thank-you 'for every buyer from now on', the second campaign type run by hand by day 14, and broadcasts to YES buyers. The founder keeps the session sheet, yet the limits say 'the seller checks the send log'. Nothing says who logs the seller's own sends between check-ins, or where the seller sees that log.

Remedy

Name the post-session log and its keeper. For example: the seller keeps the sheet and the founder reviews it at the day-4 and day-14 check-ins. List the checks the seller makes before each send.

R2-18 — COMPLETENESS

Problem

'Settings for every session' covers only the call. After it the seller runs campaigns alone, and the app's defaults point the other way. Send defaults to WhatsApp plus email. Win-back, second-order, cross-sell and festival default to an offer, flat or percent; the automatic batch uses 10%. A connected Cloud API sends the fixed template. The default win-back voice is the 'bad' message. The after-yes change tells sellers to run a second type by hand without giving them these settings.

Remedy

Add the session settings to the after-yes handover as a short checklist the seller keeps: email unticked, No discount, every row edited with its reason and the YES line, tap-to-send only.

R2-19 — COMPLETENESS

Problem

US Shopify sellers are the second target, but sessions are WhatsApp-only and US email stays off until an unsubscribe link exists, which the feature gate delays. Most US buyers are not on WhatsApp. v3's US workaround, 'export the list to Shopify Email / Klaviyo', goes unmentioned and would bypass the reason, YES and frequency rules. The design never says what a US session sends.

Remedy

State the US path. Either US sessions pause until the unsubscribe link exists, or they export only reason-filtered lists to the seller's own email tool (which provides the unsubscribe link) under the same frequency rules.

R2-20 — COMPLETENESS

Problem

The decision rules say what keeps the reason-based rules ('replies in at least half the sessions') but not what changes or drops them. No decision is set for replies in fewer than half the sessions, or for replies that bring no orders within 7 days. The 'drops' part of the round-1 obligation is still unmet.

Remedy

Add the failure branch. For example: replies in fewer than half the sessions trigger a review of the message wording and list choice with sellers before the next 5 sessions (as v3's 'sent messages but got no replies' row did). Say which result would drop the session promise.

R2-21 — COMPLETENESS

Problem

The first decision rule fires on '2+ blocks', and the day-4 check-in asks 'anyone block you?'. WhatsApp does not tell senders when someone blocks them, so sellers cannot report blocks reliably and this trigger may never fire.

Remedy

Use signals sellers can observe: a WhatsApp warning or restriction notice, or buyers replying 'stop' or complaining. Or define a proxy, for example messages still at one grey tick after 7 days.

R2-22 — CONSISTENCY

Problem

Step 1's fallback says that when nothing is new, the seller photographs 'one piece now; that becomes the reason'. The Reason definition requires 'something new and specific to that buyer' (new or restocked, matching, festival, refill, recent order). An existing piece photographed on the call is none of these. Step 3 would then message every buyer in that category: a send with a picture but no reason, against premise 2, and against Brand.md's honesty rule if the piece is presented as new.

Remedy

Allow the fallback only for a piece that is genuinely new or restocked, or that matches each buyer's purchase. Otherwise go straight to step 4 and send nothing to past buyers.

R2-23 — CONSISTENCY

Problem

The thank-you rule is 'Order date + the seller's usual delivery days + 2 days (about days 4 to 10)'. Session step 2 sends to the thank_you list, or to 'orders 2 to 14 days old'. That includes buyers whose parcel has not arrived (days 2 to 3) and buyers past the window (days 11 to 14).

Remedy

In step 2, drop rows ordered fewer than delivery days plus 2 days ago. Or widen the rule to the app's 2-to-14-day window and say why.

R2-24 — CLARITY

Problem

The thank-you row says 'every buyer gets this once'. The limits say 'at most 1 message per type ever, plus the thank-you', and 'A new order... resets the count'. It is unclear whether a repeat buyer gets a thank-you, and another YES ask, after every order or only after the first. The app's thank_you list includes repeat buyers and allows a thank-you every 30 days.

Remedy

State whether the thank-you is once per buyer or once per order, and whether it repeats the YES ask to buyers who were already asked.

R2-25 — CLARITY

Problem

An offer message is defined as one that ‘contains a discount, a code, or a direct “buy now” ask’. With No discount, the app still issues a code per buyer. When the shop is published, it appends a link carrying that code as ref= to every message, edited ones included (message_for adds the link when it is missing). Under the definition, every in-app ‘update’ from a seller with a published shop contains a code, so it counts against the 1-per-30-days offer limit.

Remedy

Exclude silent tracking links from ‘code’ in the definition (for example: ‘a visible discount code’). Say whether a shop link alone counts as a ‘buy now’ ask.

R2-26 — CLARITY

Problem

The win-back row allows buyers 120 to 365 days quiet ‘only with a strong reason’. Every message already needs a reason, and ‘strong’ is not defined. The ‘Good’ example writes to a buyer who bought in March, about 200 days before these October sessions, which puts it in that undefined zone.

Remedy

Define a strong reason (for example: the exact item or its restock, or last year’s festival), or drop the 120-to-365-day exception for the first sessions. Change the example to a buyer 60 to 120 days quiet, or label it as a strong-reason case.

R2-27 — CLARITY

Problem

‘Automatic every-second-Monday batch: switch it off during the session. Reconsider at day 14’ does not say whether the batch stays off after the call, who reconsiders, or what must be true to turn it back on. Turned back on unchanged, it returns with the 10% DEFAULT_OFFER, the ‘we’ve missed you’ voice, and festival batches chosen without reasons.

Remedy

State that the batch stays off after the session. Give the day-14 condition and the settings for turning it back on (offer none; every row edited or removed before approval), or keep it off until the gate is met.

R2-28 — CLARITY

Problem

The feature gate counts sellers who ‘sent at least 5 reason-based messages and reported replies at their day-4 check-in’. It is unclear whether a seller who reports zero replies counts, which decides whether new features can unlock despite a poor reply rate.

Remedy

Reword to ‘reported their reply count (zero included)’, or require at least one reply, and say which.

PRIOR FINDING EVIDENCE

R1-13 → R2-9 (persisting)

Change 6 replaces the messages-on-the-call row, the weekly win-back row and the 60%+ decision rule. Its ‘Reply rate 15%+ / 10%+’ row is v3’s outreach DM reply rate, so v3’s buyer-reply target (‘Sellers with a customer reply within 24 hours: 60% of Branch A’) stays and still conflicts with ‘no target yet’.

R1-22 → R2-20 (persisting)

The new decision-rules table covers when to keep the rules, when to start on C and when to change the pitch. It still has no outcome that changes or drops the reason-based rules when replies are poor.
